

Contents

1. Objective of Control Engineering	
1.1. General	1
1.2. Exposition of the control problem with the help of some examples	2
1.2.1. Control of a communication channel	2
1.2.2. Room heating	4
1.2.3. Ship course control	6
1.3. Stability problem	9
2. Analytical Description of the Dynamic Behaviour of a Control Process	
2.1. Transfer element, block diagram	13
2.2. Normalization and linearization	16
3. Dynamic Response of Simple Transfer Elements	
3.1. Proportional element with first order lag (PT_1)	19
3.1.1. Separately excited direct current generator	19
3.1.2. Further examples	22
3.1.3. General differential equation of first order	23
3.2. Proportional element with higher order lag	26
3.2.1. Second order transfer element (PT_2)	26
3.2.2. Further examples	28
3.2.3. Proportional element of higher order lag ($PT_n D_m$)	29
3.3. Integrating transfer elements	29
3.3.1. Integrator (I)	29
3.3.2. Integrator with lag (IT_1)	31
3.3.3. Double integrator (I_2)	32
3.4. Transportation delay element	33
4. Calculation of the System Response for Different Input Functions	
4.1. Impulse function and impulse response	36
4.2. Ramp function and ramp response	38
4.3. Calculation of the response of a linear transfer element to an arbitrary excitation function	40
4.4. Ramp error and step error integral	42
4.4.1. Ramp error	42
4.4.2. Step error integral	44
5. The Transfer Function	
5.1. Properties and complex representation of rational functions	46
5.1.1. Poles and zeros	46
5.1.2. Mapping of a polynomial	48
5.1.3. Mapping of a reciprocal polynomial	52
5.1.4. Rational function	54
5.2. Logarithmic frequency characteristics	55

5.2.1.	Bode diagram	55
5.2.2.	Example	63
6.	Negative Feedback and Control	
6.1.	Feedback	66
6.2.	Examples	68
6.2.1.	Direct current magnetic amplifier	68
6.2.2.	Electronic operational amplifier with frequency dependent negative feedback	73
6.2.3.	Hydraulic servo motor with feedback	78
6.3.	Stability	79
7.	Stability of a Control Loop	
7.1.	Stability and damping	82
7.2.	Numerical stability criteria	85
7.3.	Graphical stability test using the characteristic equation	87
7.3.1.	Phase integral	87
7.3.2.	$N_g(p)$ is a polynomial	88
7.3.3.	$N_g(p)$ is a special transcendental function	92
7.4.	Stability test using the open loop frequency response locus (Nyquist)	94
7.5.	Examples of applying the Nyquist criterion, special cases	96
7.5.1.	Proportional loop	96
7.5.2.	Integral loop	97
7.5.3.	Conditionally stable control	98
7.5.4.	Open loop instability	99
8.	Application of the Nyquist Criterion to the Determination of Free Control Parameters	
8.1.	Gain and phase margin	103
8.2.	Converting the Nyquist criterion to the Bode diagram	108
8.3.	General aspects for the design of a control loop	110
9.	Functional Blocks for Controllers and Control Processes	
9.1.	Minimal phase functions	115
9.1.1.	Poles	115
9.1.2.	Zeros	115
9.1.3.	Relationship between magnitude and phase	117
9.2.	Non-minimal phase functions	118
9.2.1.	All-pass function of first order	118
9.2.2.	All-pass function of second order	121
9.2.3.	All-pass function of higher order, transportation delay element	123
10.	Proportional Controller (P)	
10.1.	Definition	125
10.2.	Realization	126

10.2.1. Electronic controllers	126
10.2.2. Electromechanical controllers	129
10.2.3. Pneumatic controllers	130
10.3. Application	131
10.3.1. Design of a second order control loop	131
10.3.2. Design of a third order control loop	133
11. Proportional Differential Controller (PD)	
11.1. Definition	137
11.2. Realization	138
11.3. Application	140
11.3.1. 'Compensation' of a lag	140
11.3.2. Second order plant	142
11.3.3. Third order plant	143
12. Integral Controller (I)	
12.1. Definition	147
12.2. Realization	148
12.2.1. Electronic integrator	148
12.2.2. Other integrators	149
12.3. Application	151
12.3.1. Second order control loop	151
12.3.2. Higher order control loop	153
13. Proportional-Integral Controller (PI)	
13.1. Definition	156
13.2. Realization	157
13.3. Application	158
13.3.1. Second order proportional plant	158
13.3.2. Integrator with lag as control plant	159
13.3.3. Third order control plant	164
14. Proportional-Integral-Differential Controller (PID)	
14.1. Definition	167
14.2. Realization	168
14.3. Application	170
14.3.1. Third order plant	170
14.3.2. Control of an undamped oscillatory plant	174
14.4. Other controllers and design procedures	178
15. Design of the Controller for a Low-Pass Control Plant of Higher Order	
15.1. Low-pass plant and equivalent time constant	180
15.2. Applying the approximation	182
15.2.1. The equivalent function describes the complete control plant	182
15.2.2. Control process contains known lags besides the low-pass section described by the equivalent function	184

16. Control Loop with Auxiliary Feedback	
16.1. Mode of operation	185
16.2. Design examples	187
16.3. Supplementary feedback	188
17. Cascade Control	
17.1. Transformation of the block diagram	190
17.2. Properties of cascade control	191
17.3. Approximate calculation of a simple cascade control	192
17.4. Generalization	194
17.4.1. Subdivision of the control plant	194
17.4.2. Integrating control process	195
17.4.3. Interactions of the control plant	195
17.5. Stability of a cascade control	199
17.5.1. Transfer function	199
17.5.2. Calculation of the stability limit for a special case	200
17.6. Example of a cascade control	201
18. Feed-Forward Control	
18.1. Open loop control with feed-forward	204
18.2. Closed loop control with feed-forward	206
18.3. Control with feed-forward of the reference signal	208
18.3.1. Static feed-forward	208
18.3.2. Dynamic feed-forward	210
19. Multivariable Control	
19.1. Exposition of the problem	214
19.2. Transfer functions and block diagram of a linear two variable control system	216
19.3. Non-interacting two variable control	219
19.3.1. Decoupling	219
19.3.2. Example of a flow and mixing control	221
19.4. Frequency-power control	224
19.4.1. Objective	224
19.4.2. Load-frequency control	229
Literature	235
Index	239
Appendix	241
