

CHAPTER 1

Introduction 1

1.1 Systems 1

1.2 Modeling, Analysis, and Control 4

1.3 Types of Models 9

1.4 Linearization 13

1.5 Feedback 19

Problems 27

CHAPTER 2

Modeling Dynamic Systems 33

2.1 Systems of Units 34

2.2 The Structure of Dynamic Models 34

2.3 Modeling Mechanical Elements 43

2.4 Examples of Mechanical Systems Models 51

2.5 Electromechanical Systems 68

2.6 Hydraulics and Liquid Level Systems 70

2.7 Hydraulic Devices 76

2.8 Pneumatic Elements 82

2.9 Thermal Systems 88

2.10 Summary 94

References 96

Problems 96

CHAPTER 3

System Response 109

3.1 Free Response of a First-Order Model 109

3.2 Step Response of a First-Order Model 115

3.3 Free Response of a Second-Order Model 120

3.4 The Characteristic Equation 126

3.5 Step Response of a Second-Order Model 132

3.6 Ramp and Sinusoidal Response Patterns 143

XVI CONTENTS

3.7	Response of Higher Order Systems	151
3.8	The Routh–Hurwitz Stability Criterion	154
3.9	Nonlinear Models and Linearization	156
3.10	Summary	166
	References	168
	Problems	169

CHAPTER 4

Transfer Functions and System Diagrams 175

4.1	The Laplace Transform and System Response	175
4.2	Transfer Functions	181
4.3	Block Diagrams	185
4.4	Impedance and Transfer Functions	193
4.5	Frequency Response and Transfer Functions	196
4.6	Interpretation of Frequency Response	212
4.7	Bandwidth and Periodic Inputs	218
4.8	The Initial and Final Value Theorems	224
4.9	Response Calculations with the Laplace Transform	226
4.10	Signal Flow Graphs	237
4.11	Summary	239
	References	240
	Problems	240

CHAPTER 5

Computer Simulation Methods 249

5.1	Numerical Methods: An Introduction	250
5.2	Advanced Numerical Methods	255
5.3	Extension to Higher Order Models	265
5.4	Conversion to State Variable Form	267
5.5	Linear Analysis as an Aid to Simulation	274
5.6	Simulation and Step Inputs	279
5.7	Vector–Matrix Methods	286
5.8	Computer-Aided Analysis and Design	298
5.9	Summary	306
	References	306
	Problems	307

CHAPTER 6**Feedback Control Systems 311**

- 6.1 Feedback Control: Concepts, History, and Applications 311**
- 6.2 Control System Structure 316**
- 6.3 Transducers and Error Detectors 326**
- 6.4 Actuators 330**
- 6.5 Control Laws 335**
- 6.6 Integral Control 345**
- 6.7 Derivative Control 351**
- 6.8 Electronic Controllers 354**
- 6.9 Pneumatic Controllers 363**
- 6.10 Hydraulic Controllers 368**
- 6.11 Summary 372**
- References 372**
- Problems 373**

CHAPTER 7**Control System Design: Modeling Considerations and Alternative Control Structures 389**

- 7.1 Selecting Controller Gains 390**
- 7.2 Design with Low-Order Models 398**
- 7.3 Nonlinearities and Controller Performance 403**
- 7.4 Compensation 409**
- 7.5 State Variable Feedback 414**
- 7.6 Pseudo-Derivative Feedback 417**
- 7.7 Interacting Control Loops 426**
- 7.8 Summary 432**
- References 432**
- Problems 433**

CHAPTER 8**The Root Locus Plot 441**

- 8.1 The Root Locus Concept 441**
- 8.2 Plotting Guides 447**
- 8.3 Some Numerical Aids 459**
- 8.4 Response Calculations from the Root Locus 464**

XVIII CONTENTS

8.5 The Complementary Root Locus 467

8.6 Applications 472

8.7 Summary 478

References 479

Problems 479

CHAPTER 9

Applications of Graphical Methods to System Design 483

9.1 System Design with Open-Loop Frequency Response Plots 483

9.2 Series Compensation and PID Control 489

9.3 Static Error Coefficients 491

9.4 Lead and Lag Compensation 492

9.5 Root Locus Design of Compensators 494

9.6 Bode Design of Compensators 501

9.7 Lag-Lead Compensation 506

9.8 Systems with Dead-Time Elements 508

9.9 Summary 518

References 518

Problems 519

CHAPTER 10

Discrete-Time Models and Sampled-Data Systems 523

10.1 Origin of Discrete-Time Models 523

10.2 Free Response 529

10.3 Sampling 532

10.4 The z Transform 538

10.5 The Pulse Transfer Function and System Response 542

10.6 Sampled-Data Systems 550

10.7 Discrete-Time Models of Higher Order 563

10.8 Summary 574

References 574

Problems 575

CHAPTER 11

Digital Control Systems 581

11.1 Digital Implementation of Control Algorithms 581

11.2 Pulse Transfer Functions for Digital Control Laws 587

11.3	Root Locus for Discrete-Time Systems	592
11.4	Direct Design of Digital Control Algorithms	595
11.5	Frequency Response Methods	599
11.6	Digital Filtering	600
11.7	Microprocessor Implementation of Digital Control: A Case Study	609
11.8	Summary	619
	References	620
	Problems	620

APPENDIX A

Some Useful Analytical Techniques 629

A.1	The Taylor Series Expansion	629
A.2	Newton Iteration	631
A.3	Fourier Series	632
A.4	Vectors and Matrices	633
A.5	Complex Number Algebra	639
A.6	A Useful Trigonometric Identity	642

APPENDIX B

The Laplace Transform 645

B.1	Transforms of Common Functions	645
B.2	Properties of the Transform	647
B.3	The Inverse Transformation and Partial Fraction Expansion	650

APPENDIX C

A Runge-Kutta Subroutine 653

APPENDIX D

Mason's Rule for Diagram Reduction 659

APPENDIX E

Simulation with an Analog Computer 663

E.1	Analog Commuter Elements	663
E.2	Designing The Computer Circuit	666
E.3	Magnitude Scale Factors	667

XX CONTENTS

- E.4 Choice of Time Scale 670**
- E.5 Use of Potentiometers 671**
- E.6 A General Procedure 672**
- E.7 Analog Simulation of Nonlinear Systems 674**

APPENDIX F

The Routh–Hurwitz and Jury Stability Criteria 675

- F.1 The Routh Array 675**
- F.2 Special Cases 678**
- F.3 Relative Stability 681**
- F.4 Jury's Stability Criterion 683**
- Reference 684**

APPENDIX G

Typical Units and Physical Constants 685

Index 689
