□ Digital Signal Processing: Theory, Analysis and Digital-Filter Design by
Somanathan B. Nair

1. **Introduction to Digital Signal Processing**
 - Signals and systems
 - Continuous-time and discrete-time signals
 - Sampling and reconstruction
 - Quantization and coding
2. **Discrete-Time Systems Analysis**
 - Linear Time-Invariant (LTI) systems
 - Impulse response
 - Discrete convolution
 - Stability and causality
3. **Z-Transform**
 - Definition and properties
 - Region of Convergence (ROC)
 - Pole-zero analysis
 - System transfer functions
4. **Fourier Analysis**
 - Discrete-Time Fourier Transform (DTFT)
 - Discrete Fourier Transform (DFT)
 - Frequency-domain representation
 - Spectral analysis
5. **Fast Fourier Transform (FFT)**
 - FFT algorithms
 - Decimation-in-Time (DIT)
 - Decimation-in-Frequency (DIF)
 - Computational efficiency
6. **Digital Filter Structures**
 - Direct-form realizations
 - Cascade and parallel structures
 - Finite-word-length effects
7. **FIR Filter Design**
 - Windowing techniques
 - Frequency sampling methods
 - Linear-phase filters
 - Filter performance analysis
8. **IIR Filter Design**
 - Butterworth filters
 - Chebyshev filters
 - Elliptic filters
 - Bilinear transformation
 - Impulse invariance method
9. **Finite Precision Effects**
 - Coefficient quantization
 - Round-off noise
 - Limit cycles

- Numerical errors

10. Applications of DSP

- Audio signal processing
- Speech processing
- Digital communications
- Control and instrumentation systems
