

Contents

Chapter 1 – Overview

- Introduction
- Physical Optics and Dyadic Green's Functions
- MATLAB Program Organization
- FORTRAN Program Organization
- Near-Field and Far-Field Analysis
- Gain and Radiated Field Relationships
- Assumed Current Distributions
- Diffraction and Ground Plane Currents
- Parabolic Reflectors
- Radar Cross Section (RCS)

Chapter 2 – Propagation

- Scalar Green's Function
- Dyadic Green's Function
- Electromagnetic Wave Propagation
- Near-Field and Far-Field Regions
- Vector Propagators
- Radiated Power Calculations
- Mathematical Identities
- FORTRAN Subroutines

Chapter 3 – Arrays and Small Antenna Elements

- Fundamentals of Antenna Arrays
- Gain–Electric Field Relationships
- Linear Arrays
- Planar Arrays
- Small Radiating Elements
- Current Distribution Models

Chapter 4 – Apertures

- Aperture Antenna Theory
- Aperture Field Distributions
- Radiation Pattern Computation
- Practical Aperture Design Techniques

Chapter 5 – Diffraction

- Fundamentals of Electromagnetic Diffraction
- Edge Diffraction
- Surface Diffraction Effects
- Numerical Diffraction Methods
- Impact on Antenna Performance

Chapter 6 – Reflector Antennas

- Parabolic Reflector Theory
- Reflector Antenna Design
- Multiple Reflector Systems
- Lens Antennas
- Radomes and Protective Structures
- Satellite and Radar Applications

Chapter 7 – Radar Cross Section (RCS)

- Fundamentals of Radar Cross Section
- Electromagnetic Scattering
- RCS Calculation Methods
- Analysis of Simple and Complex Targets
- Radar Applications

Appendices

- Mathematical Formulas and Identities
- MATLAB Programs
- FORTRAN Programs
- C Language Routines
- References and Bibliography
- Index
