

Table of Contents

Introduction to Electromagnetic Field Problems

- Basic concepts of field theory
- Engineering applications
- Problem formulation in electromagnetics
- 2. Fundamental Electromagnetic Equations**
 - Maxwell's equations
 - Boundary conditions
 - Scalar and vector potentials
- 3. Analytical Methods**
 - Separation of variables
 - Green's functions
 - Integral transform techniques
 - Conformal mapping
- 4. Numerical Methods**
 - Finite difference method (FDM)
 - Finite element method (FEM)
 - Boundary element method (BEM)
 - Variational approaches
- 5. Electrostatic Field Problems**
 - Electric potential distribution
 - Capacitance calculation
 - Electrostatic force evaluation
- 6. Magnetostatic Field Problems**
 - Magnetic field computation
 - Magnetic circuits
 - Ferromagnetic materials
 - Magnetic saturation effects
- 7. Time-Dependent Field Problems**
 - Eddy currents
 - Electromagnetic diffusion
 - Harmonic field analysis
- 8. Applications in Electrical Engineering**
 - Transformers
 - Rotating electrical machines
 - Electromagnetic actuators
- 9. Computational Techniques**
 - Discretization strategies
 - Matrix solution methods
 - Numerical stability and convergence
- 10. Case Studies and Practical Applications**
 - Comparison of analytical vs numerical solutions
 - Design optimization of electromagnetic devices
