

Contents

1. Introduction to Signals and Systems

- Continuous-time and discrete-time signals
- Signal classification
- System properties

2. Linear Time-Invariant (LTI) Systems

- Impulse response
- Convolution
- Properties of LTI systems
- Interconnections of systems

3. Fourier Series

- Periodic signal representation
- Harmonic analysis
- Frequency-domain interpretation

4. Fourier Transform

- Aperiodic signals
- Spectrum analysis
- Fourier Transform properties
- Filtering applications

5. Laplace Transform

- Complex frequency domain
- Transfer functions
- Poles and zeros
- Stability analysis

6. Z-Transform

- Discrete-time system analysis
- Region of convergence (ROC)
- Difference equations
- Stability

7. Sampling and Reconstruction

- Sampling theorem

- Nyquist rate
- Aliasing
- Signal reconstruction

8. Filters and Signal Processing

- Low-pass filters
- High-pass filters
- Band-pass filters
- Frequency response

9. State-Space Analysis

- State variables
- Matrix representation
- Controllability
- Observability

10. Engineering Applications

- Communications
- Control systems
- Digital signal processing (DSP)
