

contents

1. **Introduction**
 - Computational methods in electric power systems
 - Mathematical modeling of power networks
 - Numerical analysis concepts and software tools
2. **Linear System Solution Methods**
 - Gaussian Elimination
 - LU Factorization
 - Numerical errors and conditioning
 - Iterative methods:
 - Jacobi Method
 - Gauss–Seidel Method
 - Conjugate Gradient Method
 - GMRES Method
 - Preconditioning techniques
 - Power system applications
3. **Nonlinear Equation Solution Methods**
 - Fixed-Point Iteration
 - Newton–Raphson Method
 - Quasi-Newton Methods
 - Continuation Methods
 - Load Flow applications
4. **Sparse Matrix Techniques**
 - Sparse matrix storage methods
 - Matrix organization and ordering
 - Computational efficiency
 - Applications to large-scale power systems
5. **Numerical Integration Methods**
 - Single-step methods
 - Multi-step methods
 - Error analysis
 - Stability considerations
 - Stiff systems
 - Differential-Algebraic Equations (DAEs)
 - Dynamic simulation of power systems
6. **Optimization Methods**
 - State Estimation
 - Linear Programming
 - Nonlinear Programming
 - Optimal Power Flow (OPF)
7. **Eigenvalue Problems**
 - Power Method
 - QR Algorithm
 - Arnoldi Methods
 - Singular Value Decomposition (SVD)

- Modal analysis
- Power system stability analysis

8. Exercises and References
