

Contents

1. Introduction to MEMS

- History of MEMS development
- Characteristics of MEMS technology
- Sensors and actuators
- Energy domains and transducers

2. Introduction to Microfabrication

- Overview of microfabrication processes
- Microelectronics fabrication flow
- Silicon-based MEMS fabrication
- Materials and processing considerations

3. Essential Electrical and Mechanical Concepts

- Semiconductor conductivity
- Crystal orientation and silicon properties
- Stress, strain, and beam mechanics
- Resonance, damping, and quality factor

4. Electrostatic Sensing and Actuation

- Electrostatic sensors and actuators
- Parallel-plate capacitors
- Comb-drive structures
- Applications in MEMS devices

5. Thermal Sensing and Actuation

- Thermal sensors and thermal actuators
- Thermal expansion principles
- Thermocouples and thermal resistors
- Sensor applications

6. Piezoresistive Sensors

- Fundamentals of piezoresistivity
- Sensor materials
- Stress analysis in MEMS structures
- Pressure, inertial, and flow sensors

7. Piezoelectric Sensing and Actuation

- Piezoelectric theory
- Piezoelectric materials (PZT, Quartz, PVDF, ZnO)
- MEMS sensing and actuation applications

8. Magnetic Actuation

- Magnetic principles in MEMS
- Micromagnetic component fabrication
- Magnetic actuator case studies

9. Summary of Sensing and Actuation Methods

- Comparison of sensing techniques
- Optical sensing
- Tunneling sensing
- RF resonance sensing

10. Bulk Micromachining and Silicon Etching

- Wet anisotropic etching
- Dry etching and DRIE
- Gas-phase etching
- Wafer technologies

11. Surface Micromachining

- Surface micromachining processes
- Structural and sacrificial materials
- Anti-stiction methods
- MEMS fabrication strategies

12. Process Synthesis and Integrated MEMS Design

- Fabrication of beams, membranes, and cantilevers
- Scanning probe technologies
- MEMS yield and manufacturing considerations
