

Contents

1. **Introduction to Simulation**
 - Definition and objectives of simulation
 - Types of simulation models
 - Applications in engineering, industry, and management
2. **Simulation Software and Systems**
 - Simulation environments and tools
 - Model development approaches
 - Software selection criteria
3. **Probability and Statistical Models**
 - Random variables and probability distributions
 - Statistical inference
 - Input data modeling
4. **Random-Number Generation**
 - Pseudo-random numbers
 - Random variate generation techniques
 - Testing random-number generators
5. **Input Modeling**
 - Data collection and analysis
 - Distribution fitting
 - Parameter estimation methods
6. **Verification and Validation of Simulation Models**
 - Model verification techniques
 - Validation procedures
 - Error detection and correction
7. **Output Analysis for Single Models**
 - Statistical analysis of results
 - Confidence intervals
 - Steady-state and terminating simulations
8. **Comparing Alternative System Designs**
 - Comparative experiments
 - Ranking and selection methods
 - Decision analysis
9. **Variance Reduction Techniques**
 - Antithetic variates
 - Common random numbers
 - Control variates and efficiency improvement

10. Optimization in Simulation

- Optimization concepts
- Search methods
- Simulation-based optimization

11. Discrete-Event Simulation Applications

- Manufacturing systems
- Communication systems
- Computer and service systems

12. Advanced Topics in Simulation

- Large-scale simulation models
- Experimental design
- Practical case studies
