

Contents

1. Introduction to Electronic System Reliability

- Basic concepts of reliability
- Reliability objectives and requirements
- Reliability measurements and parameters

2. Probability and Statistics for Reliability Engineering

- Statistical distributions
- Failure probability analysis
- Reliability calculations and prediction

3. Failure Mechanisms in Electronic Components

- Semiconductor failures
- Resistors, capacitors, and connectors
- Component aging and wear-out mechanisms

4. Reliability Modeling and Prediction

- Reliability mathematical models
- MTBF (Mean Time Between Failures)
- System reliability evaluation

5. Reliability-Oriented System Design

- Design for reliability principles
- Safety margins and derating methods
- Reducing system failure risks

6. Reliability Testing and Quality Control

- Environmental testing
- Accelerated life testing
- Qualification and acceptance procedures

7. Failure Analysis and Diagnostic Methods

- Failure identification techniques
- Root cause analysis
- Diagnostic procedures and troubleshooting

8. Reliability Maintenance and Management

- Preventive and corrective maintenance
- Reliability management strategies
- Documentation and lifecycle monitoring

9. Industrial Applications of Reliability Control

- Telecommunications systems
- Industrial electronic equipment
- Aerospace and military electronics
