

Contents

Chapter 1: Introduction

- Multimode propagation concepts
- Random imperfections in transmission media
- Optical and microwave applications
- Statistical description of propagation

Chapter 2: Coupled Line Equations

- Coupled-mode theory
- Waveguide modal interactions
- Matrix representation of mode coupling
- Deterministic and random coupling models

Chapter 3: Guides with White Random Coupling

- Stochastic coupling processes
- Average transfer functions
- Coupled power equations
- Power fluctuations
- Impulse response statistics

Chapter 4: Examples — White Coupling

- Two-mode waveguides
- Four-mode waveguides
- Coherent and incoherent excitation
- Practical propagation examples

Chapter 5: Directional Coupler with White Propagation Parameters

- Random directional couplers
- Statistical transfer characteristics
- Coupling efficiency analysis

Chapter 6: Guides with General Coupling Spectra

- Frequency-dependent coupling
- Non-white random processes
- Spectral characterization of randomness
- Advanced propagation models

Chapter 7: Four-Mode Guide with Exponential Coupling Covariance

- Multi-mode interaction analysis
- Covariance functions
- Statistical mode evolution

Chapter 8: Random Square-Wave Coupling

- Piecewise-random coupling models
- Markov processes
- Statistical transmission analysis

Chapter 9: Multi-Layer Coatings with Random Optical Thickness

- Optical coatings and filters
 - Random layer thickness effects
 - Reflection and transmission statistics
 - Optical windows and mirrors
-
