

Contents

I. Fundamentals of Semiconductors

- Crystal structure of semiconductors
 - Energy band theory (valence & conduction bands)
 - Fermi-Dirac statistics
 - Carrier concentration (electrons and holes)
 - Doping (n-type and p-type semiconductors)
-

II. Carrier Transport Phenomena

- Drift current (electric field-driven motion)
 - Diffusion current (concentration gradient-driven motion)
 - Carrier mobility
 - Electrical conductivity
 - Continuity equation
-

III. PN Junction

- Formation of PN junction
 - Depletion region
 - Built-in potential
 - Forward and reverse bias
 - I-V characteristics of PN diode
 - Current mechanisms (diffusion and recombination)
-

IV. Semiconductor Diodes

- Ideal diode model
 - Real diode behavior (non-ideal effects)
 - Zener diode and avalanche breakdown
 - Breakdown mechanisms
 - Schottky diode
-

V. Bipolar Junction Transistors (BJT)

- NPN and PNP structures
 - Operating regions (cutoff, active, saturation)
 - Carrier injection and transport
 - Current gain (β)
 - Early effect and non-idealities
-

VI. MOS and MOSFET Devices

- Metal-Oxide-Semiconductor structure
 - MOS capacitor behavior
 - Accumulation, depletion, inversion regimes
 - Threshold voltage (V_{th})
 - NMOS and PMOS operation
 - Channel current transport
-

VII. Advanced Physical Effects

- High electric field effects
 - Velocity saturation
 - Quantum tunneling
 - Short-channel effects
 - Device reliability issues
-

VIII. Optoelectronic Devices

- Photodiodes
- Light-emitting diodes (LEDs)
- Semiconductor lasers
- Light-matter interaction
