

Table of Contents

1. Magnetic Circuits and Electromagnetic Principles

- Magnetic field and magnetic flux
- Flux density
- Magnetomotive force (MMF)
- Reluctance
- Inductance
- Magnetization curve
- Hysteresis and eddy-current losses
- Magnetic energy

2. Electromechanical Energy Conversion

- Principles of energy conversion
- Magnetic field energy
- Coenergy
- Electromagnetic force
- Electromagnetic torque
- Single- and double-excitation systems
- Mechanical equations of motion

3. Transformers

- Ideal and practical transformers
- Turns ratio
- Equivalent circuit
- No-load and short-circuit tests
- Losses and efficiency
- Voltage regulation
- Single-phase and three-phase transformers
- Star and delta connections
- Autotransformers

4. Rotating Electrical Machines

- Basic operating principles
- Stator and rotor construction
- Induced EMF
- Magnetomotive force
- Electromagnetic torque

- Rotating magnetic field
- Armature reaction

5. DC Machines

- DC generators
- DC motors
- EMF and torque equations
- Separately excited, shunt, series, and compound machines
- Torque-speed characteristics
- Efficiency
- Speed control

6. Induction Machines

- Rotating magnetic field
- Slip
- Three-phase induction motor
- Equivalent circuit
- Torque-speed characteristics
- Power flow
- Efficiency
- Starting methods
- Speed control
- Motor, generator, and braking operation

7. Synchronous Machines

- Operating principle
- Synchronous generators / alternators
- Synchronous motors
- Salient-pole and cylindrical rotors
- Equivalent circuit
- Phasor diagrams
- Voltage regulation
- Excitation
- Power and torque

8. Machine Control and Power Electronics

- Motor control

- Rectifiers and converters
- Thyristors
- Speed control
- Power electronic drives
