

Table of contents

Chapter I. Static Maximal Flow (pp. 1–35)

1. Introduction
2. Networks and Flows in Networks
3. Notation
4. Cuts
5. Maximal Flow
6. Disconnecting Sets and Cuts
7. Multiple Sources and Sinks
8. The Labeling Method for Solving Maximal Flow Problems
9. Lower Bounds on Arc Flows
10. Flows in Undirected and Mixed Networks
11. Node Capacities and Other Extensions
12. Linear Programming and Duality Principles
13. Maximal Flow Value as a Function of Two Arc Capacities

Chapter II. Feasibility Theorems and Combinatorial Applications (pp. 36–92)

1. A Supply-Demand Theorem
2. A Symmetric Supply-Demand Theorem
3. Circulation Theorem
4. The König–Egerváry and Menger Graph Theorems
5. Construction of a Maximal Independent Set of Admissible Cells
6. A Bottleneck Assignment Problem
7. Unicursal Graphs
8. Dilworth’s Chain Decomposition Theorem for Partially Ordered Sets
9. Further Combinatorial Applications

Chapter III. Minimal Cost Flow Problems (pp. 93–172)

1. Introduction to Minimal Cost Flow Problems
2. The Optimal Assignment Problem
3. Equivalence of Hitchcock and Minimal Cost Flow Problems
4. Optimality Conditions and Flow Adjustments
5. The Caterer Problem
6. Project Cost Curves
7. Constructing Minimal Cost Circulations
8. Further Applications of Minimum-Cost Flow Models

Chapter IV. Multi-Terminal Maximal Flows (pp. 173–192)

1. Introduction to Multi-Terminal Flow Problems
2. Maximal Flows Between Multiple Pairs of Nodes
3. Network Synthesis
4. Further Results on Multi-Terminal Maximal Flows
