

Fluid Mechanics

Relevant Table of Contents

1. Introduction to Fluid Mechanics

- Definitions and properties of fluids
- Continuum hypothesis
- Viscosity, compressibility, and surface tension
- Newtonian and non-Newtonian fluids

2. Fluid Statics

- Pressure and pressure variation
- Hydrostatic equilibrium
- Forces on submerged surfaces
- Buoyancy and stability

3. Fluid Kinematics

- Lagrangian and Eulerian descriptions
- Streamlines, pathlines, and streaklines
- Acceleration and deformation of fluid elements
- Steady and unsteady flows

4. Fundamental Equations of Fluid Mechanics

- Conservation of mass
- Continuity equation
- Conservation of momentum
- Euler and Navier-Stokes equations
- Conservation of energy

5. Ideal Flows and Bernoulli's Theorem

- Incompressible and inviscid flow
- Bernoulli's theorem
- Applications to pipes and jets
- Velocity and flow-rate measurements

6. Viscous Flows

- Laminar flow
- Flow through pipes
- Poiseuille's law
- Major and minor head losses

7. Dimensional Analysis and Similarity

- Dimensions and units
- Buckingham's theorem

- Reynolds number
- Other dimensionless numbers
- Hydraulic modeling and similarity

8. Turbulent Flows

- Characteristics of turbulence
- Turbulent fluctuations
- Reynolds-averaged Navier-Stokes equations
- Turbulence modeling
- Head losses in turbulent flow

9. Boundary Layers

- Formation and development of boundary layers
- Laminar and turbulent boundary layers
- Boundary-layer separation
- Drag and lift

10. Flow Around Bodies

- Flow around plates and cylinders
- Drag and lift forces
- Separated flows
- Aerodynamic and hydrodynamic applications

11. Flow in Pipes and Pipe Networks

- Pipes in series and parallel
- Hydraulic networks
- Pumps and hydraulic machinery
- Flow-rate and head-loss calculations

12. Free-Surface Flows

- Open-channel flows
- Uniform and steady flow
- Froude number
- Hydraulic jumps
- Gradually varied flow

13. Compressible Flows

- Properties of gases
- Subsonic and supersonic flow
- Mach number
- Shock waves
- Flow through nozzles

14. Potential Flow and Stream Functions

- Irrotational flows
- Velocity potential
- Stream function
- Flow around airfoils

15. Introduction to Computational Fluid Dynamics

- Discretization of the governing equations
- Basic numerical methods
- Introduction to CFD
- Applications and interpretation of results

16. Applications and Problems

- Applied exercises
- Calculation problems
- Case studies in hydraulics and aerodynamics
- Comprehensive review problems
