

Table of Contents

Chapter 1 — Introduction and Basic Concepts

- The use of thermodynamics in engineering
- Systems and control volumes
- Properties and states
- Processes and cycles
- Units and dimensions
- Specific volume
- Pressure
- Temperature
- Thermodynamic equilibrium
- Engineering analysis and design

Chapter 2 — Energy and the First Law of Thermodynamics

- Energy concepts
- Work
- Heat transfer
- Internal energy
- Kinetic energy
- Potential energy
- Conservation of energy
- Energy balance for closed systems
- Energy analysis of cycles

Chapter 3 — Evaluating Properties

- Simple compressible substances
- Phase and phase-change processes
- Property diagrams
- Pressure–volume–temperature relationships
- Saturated liquid and vapor
- Two-phase liquid–vapor mixtures
- Superheated vapor
- Compressed liquid
- Quality (vapor quality)
- Thermodynamic property tables
- Ideal-gas model

Chapter 4 — Control Volume Analysis Using Energy

- Conservation of mass
- Mass flow rate

- Energy balance for control volumes
- Steady-state operation
- Nozzles and diffusers
- Turbines
- Compressors
- Pumps
- Heat exchangers
- Throttling devices
- Steady-flow engineering devices

Chapter 5 — The Second Law of Thermodynamics

- Limitations of the First Law
- Thermal reservoirs
- Heat engines
- Refrigerators and heat pumps
- Kelvin–Planck statement
- Clausius statement
- Reversible and irreversible processes
- Carnot cycle
- Thermal efficiency
- Coefficient of performance
- Thermodynamic temperature scale

Chapter 6 — Using the Second Law of Thermodynamics

- Entropy
- The Clausius inequality
- Entropy change
- Entropy balance
- Entropy generation
- Entropy of a pure substance
- T–s diagrams
- Isentropic processes
- Isentropic efficiencies
- Entropy analysis of closed systems
- Entropy analysis of control volumes

Chapter 7 — Exergy Analysis

- Exergy and the environment
- Dead state
- Exergy associated with heat transfer
- Exergy of a closed system
- Flow exergy
- Exergy balance

- Exergy destruction
- Exergetic efficiency
- Irreversibility
- Engineering applications of exergy analysis

Chapter 8 — Vapor Power Systems

- The Rankine cycle
- Simple Rankine cycle
- Superheating
- Reheat
- Regeneration
- Feedwater heating
- Steam extraction
- Analysis of vapor power plants
- Improving cycle performance

Chapter 9 — Gas Power Systems

- Gas power cycles
- Air-standard assumptions
- Otto cycle
- Diesel cycle
- Dual cycle
- Brayton cycle
- Gas-turbine engines
- Regeneration
- Intercooling
- Reheating
- Cycle efficiency

Chapter 10 — Refrigeration and Heat Pump Systems

- Refrigeration systems
- Vapor-compression refrigeration cycle
- Refrigerators
- Heat pumps
- Coefficient of performance
- Refrigerants
- Analysis of refrigeration components
- Actual refrigeration cycles
- Performance improvements

Chapter 11 — Thermodynamic Relations

- Fundamental thermodynamic relations

- Equations of state
- Property relations
- Maxwell relations
- Specific heats
- Enthalpy relations
- Entropy relations
- Real-fluid behavior

Chapter 12 — Ideal Gas Mixtures and Psychrometrics

- Mixtures of ideal gases
- Mass and mole fractions
- Partial pressures
- Properties of gas mixtures
- Moist air
- Relative humidity
- Humidity ratio
- Dew-point temperature
- Wet-bulb temperature
- Psychrometric charts
- Air-conditioning applications

Chapter 13 — Gas Mixtures and Combustion

- Chemical reactions
- Fuels and oxidizers
- Combustion equations
- Air–fuel ratio
- Complete and incomplete combustion
- Enthalpy of formation
- Enthalpy of combustion
- Heating values
- Adiabatic flame temperature
- Energy analysis of combustion

Chapter 14 — Chemical and Phase Equilibrium

- Chemical equilibrium
- Phase equilibrium
- Chemical potential
- Gibbs function
- Equilibrium constants
- Chemical reactions at equilibrium
- Liquid–vapor equilibrium
- Applications to reacting systems
