

# Contents

- **Introduction to Satellite Communications**

- Evolution and history of satellite communications
- Applications of communication satellites
- Basic architecture of satellite communication systems

- **Satellite Orbits and Launching**

- GEO, MEO, and LEO satellites
- Orbital mechanics and parameters
- Satellite launch and station keeping

- **Frequency Spectrum and Propagation**

- L, S, C, X, Ku, and Ka bands
- Frequency allocation and reuse
- Propagation effects and atmospheric losses

- **Satellite Link Design**

- Uplink and downlink
- Link budget analysis
- Signal-to-noise ratio (SNR)
- Carrier-to-noise ratio (C/N)

- **Multiple Access Techniques**

- FDMA (Frequency Division Multiple Access)
- TDMA (Time Division Multiple Access)
- CDMA (Code Division Multiple Access)

- **Satellite Subsystems**

- Antennas
- Transponders
- Power supply systems
- Thermal control systems
- Telemetry, Tracking, and Command (TT&C)

- **Digital Satellite Communications**

- Digital modulation techniques
- Multiplexing

- Data transmission methods
- **Error Control Coding**
  - Error detection and correction
  - Block codes
  - Convolutional codes
  - Forward Error Correction (FEC)
- **Satellite Networks and VSAT Systems**
  - VSAT architecture
  - Network configurations
  - Business and enterprise applications
- **Mobile Satellite Communications**
  - Maritime communications
  - Aeronautical communications
  - Personal mobile satellite services
- **Navigation and Remote Sensing Satellites**
  - GPS and GNSS systems
  - Earth observation satellites
  - Remote sensing applications
- **Reliability and Future Trends**
  - Satellite reliability and redundancy
  - Emerging satellite technologies
  - Future communication systems
