

Table of Contents

1. Introduction to Communication, Command and Control Systems

- Concept of command and control
- Role of communication in command and control
- Basic system concepts
- Information flow in command systems
- Communication requirements
- Civil, military and administrative applications

2. Communication Systems and Networks

- Basic communication networks
- Point-to-point communication
- Network structures
- Communication channels
- Information sources and destinations
- Communication links
- Network organization
- Centralized and distributed communication

3. Information and Data Transmission

- Information representation
- Data transmission
- Analog and digital information
- Data signals
- Transmission rates
- Data integrity
- Information transfer between processing points
- Serial and parallel transmission

4. Communication Channels

- Transmission media
- Wired communication
- Radio communication
- Microwave links
- Channel characteristics
- Bandwidth
- Attenuation
- Distortion
- Interference
- Noise

5. Modulation and Signal Transmission

- Principles of modulation
- Analog modulation
- Digital modulation
- Carrier signals
- Signal bandwidth
- Demodulation
- Signal detection
- Transmission efficiency

6. Digital Communication Techniques

- Digital data transmission
- Binary signalling
- Pulse transmission
- Coding
- Error detection
- Error correction
- Synchronization
- Data communication protocols

7. Computers in Communication Systems

- Computer-controlled communication
- Computers as communication nodes
- Data processing
- Input/output interfaces
- Data acquisition
- Information processing
- Computer-to-computer communication
- Real-time communication

8. Command and Control System Architecture

- Command and control functions
- System hierarchy
- Centralized systems
- Distributed systems
- Information-processing centres
- Communication links between processing centres
- System interfaces
- Data flow and control flow

9. Real-Time Communication and Control

- Real-time information
- Time-critical data
- Response time
- Data acquisition and processing
- Feedback information
- Control commands
- Communication delays
- Reliability of real-time systems

10. Reliability and Performance of Communication Systems

- System reliability
- Availability
- Redundancy
- Communication failures
- Fault detection
- Fault tolerance
- Performance evaluation
- Security and protection of information

11. Practical Design of Communication Networks

- Communication-system requirements
- Selection of communication channels
- Network design
- Capacity and traffic considerations
- Hardware and equipment requirements
- System implementation
- Cost and performance considerations
- Advantages and limitations of different architectures

12. Applications of Communication Command and Control Systems

- Military command and control
 - Civil applications
 - Administrative systems
 - Industrial control
 - Computer-controlled communication
 - Large-scale information networks
 - Integrated command and communication systems
-
