

Contents

Part I – Fundamentals of Solid-State Physics

1. Structure of Solids

- Atomic structure of materials
- Types of chemical bonds
- Crystal lattices and crystal structures
- Crystal defects and imperfections

2. Mechanical Properties of Solids

- Elastic and plastic deformation
- Dislocations in crystals
- Mechanical strength of materials

3. Lattice Vibrations

- Atomic vibrations in solids
- Phonons
- Thermal conductivity mechanisms

Part II – Electrons in Solids

4. Quantum Theory of Electrons

- Wave–particle duality
- Schrödinger equation
- Quantum states of electrons

5. Energy Band Theory

- Formation of energy bands
- Free and bound electrons
- Conductors, insulators, and semiconductors

6. Electron Distribution

- Fermi–Dirac statistics
- Fermi level
- Density of states

Part III – Semiconductor Physics

7. Intrinsic Semiconductors

- Electron–hole pair generation
- Charge carriers
- Carrier concentration

8. Extrinsic Semiconductors

- n-type semiconductors
- p-type semiconductors
- Impurity doping and compensation

9. Charge Transport Phenomena

- Carrier mobility
- Diffusion and drift
- Electrical conductivity
- Hall effect

Part IV – Semiconductor Devices

10. p–n Junction

- Formation of the depletion region
- Forward and reverse bias
- Current transport mechanisms

11. Semiconductor Devices

- Diodes
- Transistors
- Basic electronic applications

12. Surface Effects and Contacts

- Metal–semiconductor contacts
- MOS structures
- Interface phenomena
