

Magnetic Resonance Microscopy

Methods and Applications in Materials Science, Agriculture and Biomedicine
Author: Bernhard Blümich & Winfried Kuhn | Year: 1992 | ISBN: 1560812028

Table of Contents

Part I: Methods and Instrumentation

NMR Microscopy Using Projection Reconstruction: Spatial encoding and image reconstruction techniques.

High-Resolution NMR Imaging of Solids: Magic Angle Spinning (MAS) and multiple-pulse sequences for solid-state analysis.

Three-Dimensional NMR Imaging: Volumetric data acquisition and visualization strategies.

Flow and Diffusion Imaging: Measuring displacement and self-diffusion at microscopic scales.

Contrast Mechanisms in MRM: T1, T2, and chemical shift contrast optimization.

Hardware for MRM: Design of gradient coils and high-sensitivity RF probes.

Part II: Applications in Materials Science

Polymer Science: Characterization of elastomers and aging processes.

Porous Media: Fluid transport and pore distribution in catalysts and rocks.

Non-Destructive Testing: Defect detection in industrial materials.

Part III: Applications in Agriculture and Plant Science

Plant Water Relations: Imaging water transport in stems, roots, and leaves.

Seed Germination: Physiological monitoring of early plant growth.

Food Science: Analysis of food structure, moisture, and processing.

Part IV: Applications in Biomedicine

Microscopic Anatomy: High-resolution imaging of small biological specimens.

Cellular Imaging: Advancements toward subcellular resolution.

Tumor Models: Growth patterns in small animal models.

Bone and Hard Tissue: Mineralized tissue and dental applications.

Book Summary: This volume chronicles the transition from clinical MRI to Magnetic Resonance Microscopy (MRM), achieving spatial resolutions below 100 micrometers. It bridges the gap between diverse fields, demonstrating how NMR principles apply equally to polymer chains, plant physiology, and biological microstructures.
