
NUMERICAL SOLUTIONS OF PARTIAL DIFFERENTIAL EQUATIONS

Edited by B. J. Noye

TABLE OF CONTENTS

Preface

1. Introduction to Partial Differential Equations

- Classification of PDEs
- Boundary and Initial Conditions
- Model Problems

2. Finite Difference Methods

- Difference Approximations
- Consistency, Stability and Convergence
- Explicit and Implicit Schemes

3. Parabolic Equations

- Heat Equation
- Crank-Nicolson Method
- Stability Analysis

4. Hyperbolic Equations

- Wave Propagation Problems
- Upwind Schemes
- Lax-Wendroff Method

5. Elliptic Equations

- Laplace and Poisson Equations
- Relaxation Methods
- Iterative Solvers

6. Finite Element Methods

- Variational Formulation
- Galerkin Approximation
- Error Estimates

7. Finite Volume Methods

- Conservation Laws
- Discretization Techniques

8. Spectral Methods

- Fourier Techniques
- Chebyshev Approximations

9. Nonlinear Partial Differential Equations

- Burgers Equation
- Numerical Treatment of Nonlinearities

10. Multigrid and Advanced Iterative Methods

11. Applications in Science and Engineering
