

Contents

1. Fundamentals of Signal Processing

- Continuous-time and discrete-time signals
- Linear Time-Invariant (LTI) systems
- Time-domain and frequency-domain analysis
- Fourier, Laplace, and Z transforms

2. Physical System Modeling

- Mathematical models of physical phenomena
- Ordinary and partial differential equations
- Linear and nonlinear dynamic systems
- Initial and boundary conditions

3. Signal Processing in Wave Phenomena

- Wave propagation
- Mechanical vibrations
- Acoustics
- Electromagnetic systems

4. Random Signals and Stochastic Processes

- Random variables
- Gaussian processes
- White noise modeling
- Statistical characterization of physical systems

5. Estimation and Filtering

- Wiener filtering
- Signal estimation theory
- Detection of signals in noise
- Optimal filtering techniques

6. Applications to Physical Models

- Electrical systems
- Mechanical systems
- Thermal and diffusion processes
- Transport phenomena

7. Numerical Simulation and Analysis

- Numerical methods
- Discretization techniques
- Computational modeling

- Validation of physical models

8. Advanced Applications

- Image processing
- Antenna and propagation analysis
- Quantum physical systems
- Complex stochastic models
