

Contents

Part I: Introduction to Signals and Systems

1. Introduction to Signals and Systems

- Definition of signals and systems
- Continuous-time and discrete-time signals
- Signal classification
- Basic system properties
- Engineering applications

2. Mathematical Description of Signals

- Elementary signals
- Exponential and sinusoidal signals
- Step and impulse functions
- Signal operations
- Periodic signals

3. System Models

- Linear systems
 - Time-invariant systems
 - Causal and noncausal systems
 - Dynamic system representations
-

Part II: Time-Domain Analysis

4. Linear Time-Invariant (LTI) Systems

- Impulse response
- Convolution integral
- Convolution sum
- System interconnections

5. Differential and Difference Equations

- Continuous-time system models
- Discrete-time system models
- Solution techniques
- Initial conditions

Part III: Fourier Analysis

6. Fourier Series

- Periodic signal representation
- Trigonometric Fourier series
- Exponential Fourier series
- Spectral analysis

7. Fourier Transform

- Fourier transform theory
- Transform properties
- Frequency-domain analysis
- Energy and power spectra

8. Applications of Fourier Methods

- Filtering
 - Signal transmission
 - Frequency response
 - Spectrum analysis
-

Part IV: Laplace Transform and Continuous-Time Systems

9. Laplace Transform Fundamentals

- Definition of the Laplace transform
- Region of convergence
- Transform properties
- Inverse Laplace transform

10. Continuous-Time System Analysis

- Transfer functions
- Pole-zero analysis
- Stability
- Frequency response

11. Control-System Applications

- System behavior
 - Feedback systems
 - Dynamic response
 - System performance
-

Part V: z-Transform and Discrete-Time Systems

12. z-Transform Fundamentals

- Definition and properties
- Region of convergence
- Inverse z-transform

13. Discrete-Time System Analysis

- Difference equations
- Transfer functions
- Pole-zero plots
- Stability analysis

14. Digital Filter Analysis

- FIR filters
 - IIR filters
 - Frequency response
 - Filter implementation
-

Part VI: State-Space Analysis

15. State Variables and State Models

- State-space representation
- State equations
- System modeling

16. State-Space Analysis Techniques

- State transition matrix

- System response
 - Stability analysis
-

Part VII: MATLAB Applications

17. MATLAB for Signals and Systems

- MATLAB fundamentals
- Signal generation
- Numerical computation

18. MATLAB-Based System Analysis

- Fourier analysis with MATLAB
- Laplace and z-transform applications
- Simulation of continuous and discrete systems
- Filter design and visualization
