

Contents :

1. **Introduction to Control Systems**
 - Basic concepts
 - Types of control systems
 - Feedback principles
2. **Mathematical Models of Dynamic Systems**
 - Mechanical systems
 - Electrical systems
 - Electromechanical systems
 - Differential equation models
3. **Transfer Function Representation**
 - Laplace transform
 - Block diagrams
 - Signal-flow graphs
 - Mason's Gain Formula
4. **Time-Domain Analysis**
 - First-order systems
 - Second-order systems
 - Higher-order systems
 - Transient and steady-state response
5. **Stability of Control Systems**
 - Characteristic equation
 - Routh-Hurwitz criterion
 - Relative stability
6. **Root Locus Techniques**
 - Construction rules
 - Controller design
 - System performance
7. **Frequency Response Methods**
 - Frequency response
 - Bode plots
 - Nyquist plots
 - Nichols charts
8. **Control System Compensation**
 - Lead compensation
 - Lag compensation
 - Lead-lag compensation
 - PID controllers
9. **State-Space Analysis**
 - State equations
 - State variables
 - State transition matrix
 - Controllability and observability
10. **Digital Control Systems**
 - Sampling
 - Z-transform
 - Digital controller implementation
 - Sampled-data systems
11. **Practical Design Examples**

- Industrial control systems
- Servo systems
- Process control
- Motion control applications

12. Appendices

- Mathematical tables
- Laplace transform tables
- MATLAB examples (if applicable)
- References
- Index
