

Contents :

1. Semiconductor Diodes

- Semiconductor materials (Si, Ge, GaAs)
- PN junction fundamentals
- Diode characteristics and models
- Zener diodes, LEDs
- Diode testing and applications

2. Diode Applications

- Load-line analysis
- Rectifiers (half-wave, full-wave)
- Clippers and clampers
- Voltage multipliers
- Practical diode circuits

3. Bipolar Junction Transistors (BJTs)

- Structure and operation
- Configurations (CB, CE, CC)
- Characteristics and parameters

4. DC Biasing – BJTs

- Operating point (Q-point)
- Biasing methods (fixed, emitter, voltage-divider)
- Stability analysis

5. BJT AC Analysis

- Small-signal models
- Amplifier analysis
- Gain and impedance

6. Field-Effect Transistors (FETs)

- JFET and MOSFET basics
- Characteristics and operation

7. FET Biasing

- Biasing techniques for FETs
- Stability considerations

8. FET Amplifiers

- Small-signal analysis
- Common-source, drain, gate configurations

9. Frequency Response of Amplifiers

- BJT and FET frequency effects
- Low and high-frequency response

10. Operational Amplifiers

- Ideal and practical Op-Amps
- Basic configurations

11. Op-Amp Applications

- Amplifiers, filters
- Integrators and differentiators
- Comparators

12. Power Amplifiers

- Class A, B, AB, C amplifiers
- Efficiency and distortion

13. Linear-Digital Integrated Circuits

- IC technology
- Digital-analog interface basics

14. Feedback and Oscillator Circuits

- Feedback principles
- Oscillator types (RC, LC, crystal)

15. Power Supplies (Voltage Regulators)

- Rectification and filtering
- Voltage regulation techniques

16. Other Two-Terminal Devices

- Special diodes and devices

17. PNP and Other Devices

- Thyristors (SCR, DIAC, TRIAC)
- Switching devices
