

Table of Contents

1. Introduction to Electromagnetic Theory

- Historical background
- Electromagnetic quantities and units
- Applications of electromagnetics

2. Vector Analysis

- Coordinate systems
- Vector algebra
- Gradient, divergence, and curl
- Integral theorems

3. Electrostatic Fields

- Coulomb's law
- Electric field intensity
- Electric flux density
- Gauss's law

4. Electric Potential

- Potential difference
- Potential gradient
- Energy and work

5. Conductors and Dielectrics

- Conducting materials
- Polarization
- Boundary conditions
- Capacitance

6. Poisson's and Laplace's Equations

- Field equations
- Boundary-value problems
- Analytical solutions

7. Magnetostatic Fields

- Magnetic flux density
- Biot–Savart law
- Ampère's circuital law
- Magnetic materials

8. Magnetic Forces and Inductance

- Lorentz force
- Magnetic torque
- Self and mutual inductance
- Magnetic energy

9. Time-Varying Fields

- Faraday's law
- Displacement current
- Maxwell's equations

10. Electromagnetic Wave Propagation

- Wave equations
- Plane waves
- Polarization
- Wave velocity

11. Transmission Lines

- Line parameters
- Reflection coefficient
- Standing waves
- Smith chart

12. Waveguides

- Rectangular waveguides
- Circular waveguides
- Propagation modes
- Cutoff frequencies

13. Electromagnetic Radiation

- Antenna fundamentals
- Radiation mechanisms
- Power density
- Radiation patterns

14. Applications of Electromagnetics

- Communication systems
- Microwave engineering
- Radar systems
- Electromagnetic compatibility (EMC)
