

Table of Contents

Introduction

- Modern Power Systems
- Power Quality Fundamentals
- Signal Processing for Power Quality
- Electromagnetic Compatibility (EMC) Standards
- Distributed Generation and Power Quality
- 2. Origin of Power Quality Variations**
 - Frequency Variations
 - Voltage Magnitude Variations
 - Voltage Unbalance
 - Voltage Fluctuations and Flicker
 - Harmonic and Waveform Distortion
- 3. Processing of Stationary Signals**
 - Signal Characterization
 - Power Quality Indices
 - Fourier Analysis and Spectral Transformation
 - Harmonic and Interharmonic Estimation
 - Broadband Spectrum Estimation
- 4. Processing of Nonstationary Signals**
 - Short-Time Fourier Transform (STFT)
 - Wavelet Transform Analysis
 - Block-Based Signal Modeling
 - Kalman Filtering
 - Time-Frequency Signal Analysis
- 5. Statistics of Power Quality Variations**
 - Time Aggregation
 - Site and System Indices
 - Power Quality Performance Indices
 - IEC and IEEE Standards
- 6. Origin of Power Quality Events**
 - Interruptions
 - Voltage Dips
 - Switching and Lightning Transients
 - Event Analysis
- 7. Triggering and Segmentation**
 - Event Detection Methods
 - Signal Segmentation Techniques
 - Wavelet-Based Detection
 - Model-Based Detection
- 8. Characterization of Power Quality Events**
 - Event Parameters
 - Voltage Magnitude and Phase Analysis
 - Three-Phase Characteristics
 - Disturbance Indices
 - Transient Characterization

9. Event Classification

- Feature Extraction
- Machine Learning Methods
- Artificial Neural Networks
- Support Vector Machines
- Rule-Based Expert Systems

10. Event Statistics

- Interruption Statistics
- Voltage Dip Statistics
- SARFI Indices
- System Reliability Assessment

11. Conclusions

- Power Quality Variations and Events
- Signal Processing Challenges
- Future Research Directions
