

Table of Contents

1. **Basic Concepts in Mobile Communications**
 - Fundamentals of mobile communication systems
 - Radio communication principles
 - Wireless network architecture
2. **Introduction: Channel and Propagation in Mobile Communications**
 - Mobile radio channels
 - Propagation mechanisms
 - Signal attenuation and fading
3. **Introduction to Mobile Systems: PMR (Private Mobile Radio Systems)**
 - PMR and PAMR systems
 - Trunked radio systems
 - Professional mobile networks
4. **Propagation Modelling in Mobile Communications**
 - Empirical propagation models
 - Okumura and Hata models
 - Coverage prediction methods
5. **Propagation Multipath**
 - Multipath propagation
 - Delay spread and Doppler effects
 - Rayleigh and Rice fading
6. **Propagation: Path Losses**
 - Free-space losses
 - Diffraction and shadowing
 - Urban and rural propagation losses
7. **Mobile Radio Engineering**
 - Link budget analysis
 - Frequency planning
 - Interference calculations
8. **Propagation in New Environments**
 - Indoor propagation
 - Microcells and picocells
 - Broadband wireless environments
9. **Mobile Communications Systems**
 - Cellular system architecture
 - Network operation principles
 - Traffic engineering
10. **Integrated Base Station Engineering**
 - Base station design
 - Antenna systems
 - RF engineering aspects
11. **Trunked Systems**
 - Trunking concepts
 - Resource allocation
 - Capacity optimization

12. The Cellular Concept

- Frequency reuse
- Cell planning
- Handover techniques

13. The GSM System

- GSM architecture
- GSM channels and protocols
- TDMA principles

14. Other Mobile Radio Systems

- DECT systems
- TETRA systems
- CDMA and wireless technologies

15. The Future: Towards Personal Communications

- Personal communication systems
- Evolution toward broadband mobile systems
- Future wireless technologies and trends
