

Table of Contents

1. **Introduction to Antenna Theory**
 - Role and functions of antennas
 - Radiation mechanisms
 - Electromagnetic wave fundamentals
 - Antenna parameters and terminology
2. **Basic Electromagnetic Principles**
 - Maxwell's equations
 - Electromagnetic fields and wave propagation
 - Near-field and far-field regions
 - Polarization concepts
3. **Wire Antennas**
 - Short dipole antennas
 - Half-wave dipole antennas
 - Monopole antennas
 - Folded dipoles
 - Loop antennas
 - Array configurations of wire antennas
4. **Radiation Characteristics of Wire Antennas**
 - Radiation patterns
 - Directivity and gain
 - Radiation resistance
 - Bandwidth and efficiency
 - Input impedance and matching techniques
5. **Aperture Antennas**
 - Concept of aperture radiation
 - Horn antennas
 - Slot antennas
 - Waveguide apertures
 - Reflector and parabolic antennas
6. **Antenna Arrays and Beam Formation**
 - Linear arrays
 - Planar arrays
 - Array factor analysis
 - Beam steering and beam shaping
7. **Transmission Lines and Feeding Methods**
 - Transmission line fundamentals
 - Antenna feeding systems
 - Impedance matching networks
 - Standing wave ratio (SWR)
8. **Measurement and Testing of Antennas**
 - Antenna measurement techniques
 - Gain and pattern measurements
 - Anechoic chamber testing
 - Calibration methods

9. Practical Applications of Antennas

- Communication systems
- Radar applications
- Satellite communications
- Broadcasting and wireless networks

10. Advanced Topics in Antenna Design

- Broadband antennas
- High-frequency and microwave antennas
- Modern antenna developments
