

Table of Contents

1. **Managing Service Level Quality in Fixed Networks**
 - Relevance and scope
 - Service Level Quality concepts
 - Fixed network management overview
2. **History**
 - Traditional network management
 - OSI management functional areas
 - **SNMP** (v1, v2, v3)
 - **MIB, RMON and RMON2**
 - Common Management Information Services (CMIS)
3. **Current Standards**
 - Systems Management System (SMS)
 - Application Response Measurement (ARM)
 - Common Information Model (CIM)
 - Service Level Agreement (SLA) factors
4. **Latest Developments**
 - Application instrumentation
 - Network probes / monitoring tools
 - Active monitoring techniques
 - Passive monitoring approaches
 - NIMI Project architecture and lessons learned
5. **A Model Agent**
 - Agent architecture
 - Endpoint and server functions
 - TCP flow management
6. **An Integration Model**
 - Integration requirements
 - Application-level traps and thresholds
 - Root-cause analysis
 - Bidirectional interaction model
 - Challenges and solutions
7. **Application Performance in a Nutshell**
 - Performance mechanisms
 - End-to-end application behavior
 - Performance summary
8. **Service Level Quality across Fixed and Wireless Networks**
 - Service quality concepts in converged networks
 - Scope and relevance of wireless–fixed integration
9. **Wireless Architectures**
 - **GSM (2G)** architecture and functions
 - **GPRS (2.5G)** architecture and protocols
 - **UMTS (3G)** architecture
 - QoS service architecture
 - 3GPP standard implications

10. Moving to Wireless

- QoS foundations
- Router scheduling and queuing
- TCP, UDP and RTP operations
- IPv6 considerations
- QoS approaches: **IntServ, RSVP, DiffServ, MPLS**
- Multimedia compression standards

11. Wireless Performance

- GPRS simulator
- 3G demonstrator
- Test laboratory methodology
- Network performance measurements
- Laboratory and live network results

12. Conclusions

- Test result synthesis
- Final conclusions and perspective
