

Table of Contents

1. **Foundations of Electronics**
 - Voltage, current, resistance, and power
 - Circuit laws and basic analysis
 - Electronic signals and measurements
2. **Semiconductor Devices**
 - Diodes and diode applications
 - Bipolar junction transistors (BJTs)
 - Field-effect transistors (FETs, MOSFETs)
 - Device characteristics and biasing
3. **Analog Circuit Design**
 - Transistor amplifiers
 - Differential amplifiers
 - Current sources and active loads
 - Feedback principles and stability
4. **Operational Amplifiers**
 - Op-amp fundamentals
 - Linear and nonlinear applications
 - Active filters
 - Precision analog circuits
5. **Filters and Signal Processing Circuits**
 - Passive and active filters
 - Frequency response
 - Noise reduction techniques
 - Signal conditioning
6. **Oscillators and Waveform Generation**
 - RC, LC, and crystal oscillators
 - Timing circuits
 - Pulse and waveform generators
7. **Digital Electronics**
 - Logic families and logic gates
 - Combinational and sequential logic
 - Counters, registers, and memories
 - Microprocessor interfacing
8. **Data Conversion and Interfacing**
 - Analog-to-digital converters (ADC)
 - Digital-to-analog converters (DAC)
 - Sensors and interface circuits
9. **Power Electronics and Power Supplies**
 - Voltage regulation
 - Linear and switching regulators
 - Power management techniques

10. Noise, Grounding, and Circuit Reliability

- Sources of electronic noise
- Shielding and grounding methods
- Thermal effects and protection circuits

11. Practical Design Techniques and Applications

- Laboratory methods
- Design optimization
- Troubleshooting and testing
- Real-world electronic applications
