

Table of Contents

1. **Introduction to System Modeling**
 - Purpose of system models
 - Physical system representation
 - Multi-domain systems
2. **Fundamentals of Bond Graph Theory**
 - Energy-based modeling concepts
 - Power variables (effort and flow)
 - Energy exchange principles
3. **Basic Bond Graph Elements**
 - Storage elements (C and I)
 - Dissipative elements (R)
 - Sources (Se and Sf)
 - Transformers (TF)
 - Gytrators (GY)
4. **Junction Structures**
 - 0-Junctions
 - 1-Junctions
 - Power conservation laws
5. **Causality Assignment**
 - Causal strokes
 - Integral and derivative causality
 - Causality rules
6. **Bond Graph Modeling Methodology**
 - Systematic model construction
 - Model simplification
 - Verification procedures
7. **Mechanical Systems Modeling**
 - Translational systems
 - Rotational systems
 - Vehicle dynamics
8. **Electrical Systems Modeling**
 - RLC circuits
 - Electromechanical devices
 - Power systems
9. **Hydraulic and Pneumatic Systems**
 - Fluid power systems
 - Pumps and valves
 - Pneumatic actuators
10. **Thermal Systems Modeling**
 - Heat transfer
 - Thermal storage
 - Thermodynamic processes
11. **Multi-Energy Domain Systems**
 - Mechatronic systems
 - Electro-mechanical coupling
 - Integrated system analysis

12. State-Space Representation

- Derivation from bond graphs
- Dynamic equations
- System simulation

13. Computer-Aided Bond Graph Modeling

- Modeling software
- Numerical simulation
- Model validation

14. Control System Applications

- Dynamic analysis
- Controller design
- System optimization

15. Advanced Bond Graph Applications

- Robotics
- Automotive systems
- Aerospace engineering
- Industrial processes
