

Table of Contents

1. **Introduction to Microwave and Millimeter-Wave Engineering**
 - Frequency ranges and applications
 - Propagation characteristics
 - Transmission media
2. **Fundamentals of Electromagnetic Waves**
 - Maxwell's equations
 - Wave propagation
 - Boundary conditions
3. **Transmission Lines**
 - Distributed parameters
 - Characteristic impedance
 - Reflection and standing waves
 - Smith chart applications
4. **Waveguides**
 - Rectangular waveguides
 - Circular waveguides
 - Propagation modes
 - Cutoff frequency
5. **Microwave Network Theory**
 - Multiport networks
 - Scattering parameters (S-parameters)
 - Signal flow analysis
6. **Passive Microwave Components**
 - Attenuators
 - Phase shifters
 - Couplers
 - Power dividers
7. **Microwave Resonators**
 - Resonant cavities
 - Quality factor (Q)
 - Resonance characteristics
8. **Microwave Filters**
 - Low-pass filters
 - High-pass filters
 - Band-pass filters
 - Band-stop filters
 - Filter synthesis methods
9. **Impedance Matching Techniques**
 - Stub matching
 - Quarter-wave transformers
 - Matching networks
10. **Ferrite Passive Devices**
 - Non-reciprocal components
 - Circulators
 - Isolators

11. Millimeter-Wave Passive Circuits

- Design constraints
- Fabrication technologies
- Performance considerations

12. Computer-Aided Design of Microwave Circuits

- Numerical methods
- Electromagnetic simulation
- Optimization techniques
