

Table of Contents

Part I — Introduction

- Ultraclean Technology for VLSI Manufacturing: An Overview

Part II — Influence of Contamination on Device Performance

- Silicon crystal quality and device characteristics
- Influence of contaminants on devices
- Metallic contamination and dielectric degradation
- Effect of surface micro-roughness

Part III — Particle Adhesion Mechanisms

- Particle deposition in air, plasma, vacuum, and liquids
- Adhesion during RCA cleaning
- Electrostatic effects on particle adhesion

Part IV — Surface Analysis and Evaluation

- Particle measurement techniques
- Chemical and molecular contamination analysis
- Electrical evaluation of impurities
- STM/AFM surface characterization

Part V — Process-Line Monitoring and Control

- Particle detection in production lines
- Pattern defect monitoring
- Cleanliness level control
- Defect analysis in wafers and devices

Part VI — Ultraclean Technology in Wafer Processing

- Oxidation and diffusion processes
- CVD (atmospheric, plasma, metal CVD)
- Physical vapor deposition
- Dry etching contamination issues
- Ion implantation
- Lithography and CMP
- Cluster tool systems

Part VII — Wafer Cleaning Technologies

- Trends in wafer cleaning
- Wet cleaning (particle, metal, organic removal)
- Micro-roughness and SC-1 effects
- Wafer drying techniques
- Watermark control and removal
- Dry and physical cleaning methods

Part VIII — Advanced Cleaning and Surface Control

- HF vapor cleaning
- Native and chemical oxide control
- Hydrogen-terminated silicon surfaces
- Organic adsorption and removal
- Wafer carrier cleaning
- Future directions in ultraclean processing
