

Hypothetical Table of Contents

1. Introduction to Transport Phenomena

- Importance of Transport Phenomena
- Overview of Momentum, Heat, and Mass Transfer

2. Fluid Mechanics (Momentum Transfer)

- Basic Concepts of Fluid Mechanics
- Fluid Statics
- Fluid Dynamics
- Viscosity and Newtonian Fluids
- Laminar and Turbulent Flow
- Flow in Pipes and Channels
- Boundary Layers

3. Heat Transfer

- Fundamental Concepts of Heat Transfer
- Conduction: Fourier's Law and Heat Conduction Equation
- Convection: Forced and Natural Convection
- Radiative Heat Transfer
- Heat Exchangers
- Transient Heat Conduction

4. Mass Transfer

- Basic Concepts of Mass Transfer
- Fick's Laws of Diffusion
- Diffusion in Gases and Liquids
- Mass Transfer in Packed Beds and Across Interfaces
- Boundary Layer Theory

5. Combined Transport Processes

- Interrelationships between Momentum, Heat, and Mass Transfer
- Multiphase Systems
- Analysis of Complex Systems (e.g., Chemical Reactors)

6. Applications of Transport Phenomena

- Chemical Engineering Applications
- Environmental Engineering Applications
- Biochemical Engineering Applications
- Industrial Applications

7. Mathematical Tools for Transport Phenomena

- Differential Equations and Boundary Value Problems
- Numerical Methods
- Dimensional Analysis

8. **Appendices**

- Physical Properties of Fluids
- Mathematical Tables
- Additional Resources for Further Study

9. **Index**
