

# Table of Contents: Worked Examples in Basic Electronics

## 1. Introduction to Basic Electronics

- Fundamental electrical quantities: voltage, current, resistance
- Ohm's law and electrical power
- Use of measuring instruments

## 2. Resistive Circuits

- Series and parallel resistor networks
- Voltage and current dividers
- Thevenin's and Norton's theorems
- Numerical application exercises

## 3. Capacitors and RC Circuits

- Charging and discharging behavior
- Time response of RC circuits
- Applications in filtering and timing
- Practical calculation examples

## 4. Inductors and RL Circuits

- Induction and self-induction phenomena
- Response of RL circuits to varying signals
- Transient and impedance studies
- Solved exercises

## 5. RLC Circuits and Sinusoidal Regimes

- Complex impedance and resonance
- Power calculations and power factor
- Phase diagrams and frequency analysis
- Numerical case studies

## 6. Semiconductors and Diodes

- PN junction characteristics
- Rectification and voltage filtering
- Zener diodes and voltage regulation
- Practical solved problems

## 7. Bipolar Junction Transistors (BJTs)

- Operating modes and biasing methods
- Transistor amplifier circuits
- Transfer curves and gain calculations
- Worked examples

## 8. Field Effect Transistors (FETs)

- Principle and characteristics
- FET amplifier circuits
- Bias point calculations
- Example applications

## 9. Operational Amplifiers

- Principles of operation
- Basic configurations: inverter, buffer, summing amplifier
- Practical applications: filtering, integration, differentiation

- Guided exercises

#### **10. Practical Applications and Projects**

- Study of small electronic circuits
- Analysis of audio amplifiers and detectors
- Complete design exercises

#### **11. Appendices**

- Tables of constants and formulas
- Standard electronic symbols
- Mathematical and trigonometric reminders
