

Table of Contents :

1. Introduction to Dynamics

1.1 Role of dynamics in engineering

1.2 Basic concepts: space, time, mass

1.3 Physical quantities and units

1.4 Mechanical system modeling

2. Particle Kinematics

2.1 Position, velocity, and acceleration

2.2 Rectilinear motion

2.3 Curvilinear motion

2.4 Cartesian, polar, and natural coordinates

2.5 Relative motion

3. Particle Kinetics

3.1 Newton's laws

3.2 Equations of motion

3.3 Work and energy

3.4 Impulse and momentum

3.5 Conservation of energy and momentum

4. Systems of Particles

4.1 Center of mass

4.2 Motion of particle systems

4.3 Conservation of momentum

4.4 Collisions (elastic and inelastic)

5. Rigid Body Dynamics (Kinematics)

5.1 Translational motion

5.2 Rotation about a fixed axis

5.3 Plane motion

5.4 Angular velocity and acceleration

6. Rigid Body Dynamics (Kinetics)

6.1 Moment of inertia

6.2 Equations of motion (Newton–Euler)

6.3 Work and energy for rigid bodies

6.4 Angular impulse

7. Mechanical Vibrations

7.1 Single-degree-of-freedom systems

7.2 Free vibrations

7.3 Damped vibrations

7.4 Forced vibrations

7.5 Resonance

8. Analytical Methods in Dynamics

8.1 D'Alembert's principle

8.2 Virtual work principle

8.3 Energy methods

8.4 Lagrange's equations

9. Engineering Applications

9.1 Real mechanical systems

9.2 Machines and mechanisms

9.3 Automotive and robotics applications

9.4 Stability analysis

10. Introduction to Advanced Dynamical Systems

10.1 Nonlinearity

10.2 Coupled systems

10.3 Complex dynamic behavior

10.4 Advanced modeling basics
