Modern Power Station Practice – Volume 1: Planning and Layout

1. Power Station Planning

- Objectives of power station planning
- Electrical generating requirements
- Selection of generating capacity
- Choice of power station type
- Planning criteria and design requirements

2. Site Selection

- Selection of the power station site
- Geographical and environmental considerations
- Availability of fuel and water
- Transport and access
- Geological and foundation conditions
- Cooling-water requirements
- Environmental and safety considerations

3. Power Station Site Layout

- General principles of site layout
- Arrangement of major plant
- Relationship between buildings and plant
- Fuel handling and storage areas
- Cooling systems
- Roads, railways and access facilities
- Drainage and auxiliary services

4. Station Design and Layout

- General station arrangement
- Main station buildings
- Boiler house and turbine house
- Control rooms
- Electrical buildings
- Auxiliary plant areas
- Equipment access and maintenance facilities

5. Civil Engineering and Building Works

- Foundations and structural requirements
- Structural design of power station buildings
- Concrete and steel structures
- Building construction
- Heavy equipment foundations
- Crane and handling facilities
- Underground structures and services

6. Plant Arrangement and Services

- Mechanical and electrical services
- Pipework and cable routes
- Water supply and drainage
- Ventilation and heating
- Fire protection
- Material handling
- Maintenance and operating requirements

7. Construction and Future Development

- Construction planning
- Construction access and facilities
- Installation of major equipment
- Commissioning considerations
- Expansion possibilities
- Space reservation for future plant
