
Contents

☐ **Part 1: Fundamentals of Semiconductors**

- Crystal structure of semiconductors (Si, Ge)
- Covalent bonding in crystals
- Energy band theory
- Valence band and conduction band
- Energy band gap (E_g)
- Density of states

☐ **Part 2: Charge Carriers and Statistics**

- Fermi–Dirac statistics
- Electron and hole concentrations
- Intrinsic semiconductors
- Extrinsic semiconductors (n-type and p-type doping)
- Fermi level and chemical potential

☐ **Part 3: Transport Phenomena**

- Drift current
- Diffusion current
- Electron and hole mobility
- Electrical conductivity
- Continuity equation
- Generation–recombination processes

☐ **Part 4: Advanced Physical Effects**

- High electric field effects
- Hall effect
- Non-linear transport
- Thermal and optical effects
- Radiative and non-radiative recombination

☐ **Part 5: Semiconductor Junctions**

- p–n junction
- Depletion region
- Built-in potential barrier
- Forward and reverse bias
- Rectification effect

□ **Part 6: Devices and Applications**

- Special diodes
- Bipolar junction transistor (BJT)
- Metal–semiconductor contacts
- Basics of semiconductor devices
