

Table of Contents

1. **Spectrally Selective Surfaces and Their Impact on Photothermal Solar Energy Conversion**
 - Spectral selectivity
 - Solar radiation absorption
 - Optical properties of surfaces
 - Thermal emission
 - Photothermal energy conversion
2. **Spectral Selectivity of Composite Materials**
 - Composite materials for solar applications
 - Optical properties
 - Light–matter interaction
 - Selective solar absorbers
 - Material design for solar conversion
3. **Solar Photoelectrolysis with Semiconductor Electrodes**
 - Principles of solar photoelectrolysis
 - Semiconductor electrodes
 - Light absorption and charge generation
 - Electron–hole separation
 - Solar-to-chemical energy conversion
 - Hydrogen production
4. **Carrier Lifetime in Silicon and Its Impact on Solar Cell Characteristics**
 - Carrier lifetime in silicon
 - Electron–hole recombination
 - Material defects and impurities
 - Carrier-lifetime measurement
 - Influence on solar-cell performance
 - Silicon material quality
5. **Problems of the Cu₂S/CdS Cell**
 - Cu₂S/CdS cell structure
 - Semiconductor properties
 - Junction characteristics
 - Photovoltaic generation
 - Degradation mechanisms
 - Stability and performance limitations
6. **Heterojunction Phenomena and Interfacial Defects in Photovoltaic Converters**
 - Semiconductor heterojunctions
 - Semiconductor interfaces
 - Interfacial defects
 - Electronic interface states
 - Carrier transport and recombination
 - Effects of interface defects on photovoltaic efficiency
