

Contents :

Front Matter

- Acknowledgments
- What's New in the Second Edition
- A Note to Professors
- Prologue

Section I — Mostly History and a Little Math

1. Solution to an Old Problem
2. Preradio History of Radio Waves
3. Antennas as Launchers and Interceptors of Electromagnetic Waves
4. Early Radio
5. Receiving Spark Transmitter Signals
6. Mathematics of AM Sidebands
7. First Continuous Waves, Negative Resistance Oscillators and the Van der Pol Equation, and the Heterodyne Concept
8. Birth of Electronics

Section II — Mostly Math and a Little History

9. Fourier Series and Their Physical Meaning
10. Convergence in Energy of the Fourier Series
11. Radio Spectrum of a Spark-Gap Transmitter
12. Fourier Integral Theorem and the Continuous Spectrum of a Nonperiodic Time Signal
13. Physical Meaning of the Fourier Transform
14. Impulse “Functions”
15. Convolution Theorems, Frequency Shifts, and Causal Time Signals

Section III — Nonlinear Circuits for Multiplication

16. Multiplying by Squaring and Filtering
17. Squaring and Multiplying with Matched Nonlinearities
18. Multiplying by “Sampling and Filtering”

Section IV — Mathematics of “Unmultiplying”

19. Synchronous Demodulation and its Problems
20. Analytic Signals and Single-Sideband Radio
21. Denouement
22. Epilogue

Technical Appendices

Appendix A

- Complex Exponentials

Appendix B

- What Is (and Is Not) a Linear Time-Invariant System (Superposition)

Appendix C

- Two-Terminal Components
- Kirchhoff's Circuit Laws
- Magnetic Coupling
- Complex Impedances
- AC Amplitude and Phase Responses
- Power and Energy
- Initial Conditions

Appendix D

- Thévenin's and Norton's Theorems

Appendix E

- Resonance in Electrical Circuits

Appendix F

- Differential and Operational Amplifiers
