

Contents :

- 1. Introduction to control theory**
 - Basic control concepts
 - Control systems
 - Feedback
 - Open-loop and closed-loop control
- 2. Control-system design**
 - Basic design principles
 - Feedback-loop design
 - Performance requirements
- 3. Automatic feedback control**
 - Feedback-loop synthesis
 - Stability
 - Control-system performance
- 4. Laplace-transform methods**
 - System representation
 - Transfer functions
 - Manipulation of dynamic-system models
- 5. Frequency-response methods**
 - Frequency response
 - Frequency-domain analysis
 - Stability and performance
- 6. Mathematical modelling**
 - Physical-system models
 - Differential equations
 - Dynamic-system representation
- 7. Nonlinear systems**
 - Nonlinear behaviour
 - Analysis of nonlinear control systems
- 8. Practical control engineering**
 - Implementation
 - Design considerations
 - Practical limitations
 - Application of control theory
- 9. Discrete-time and digital control**
 - Sampling
 - Discrete-time systems
 - Digital controllers
- 10. Multivariable/state-space control**
 - State variables
 - State-space representation
 - Multivariable systems
- 11. Further control-theory concepts**
 - Modern control approaches
 - Mathematical and engineering aspects of control
