

Contents :

1. Introduction

- Control systems
- History and development of automatic control
- Digital computer control
- Applications of control theory
- The control problem

2. Mathematical Models of Physical Systems

- Differential equations
- Electrical and mechanical systems
- Electromechanical systems
- Hydraulic and pneumatic systems
- Thermal systems
- Robotic mechanisms
- Transfer functions
- Block-diagram algebra
- Signal-flow graphs

3. Feedback Characteristics of Control Systems

- Feedback and non-feedback systems
- Effects of feedback
- Parameter variations
- System dynamics
- Disturbance rejection
- Linearizing effects of feedback
- Regenerative feedback

4. Control Systems and Components

- Control-system components
- Sensors and transducers
- Actuators
- DC and AC servomotors
- Tachogenerators
- Control valves and related elements

5. Time Response Analysis, Design Specifications and Performance Indices

- Standard test signals
- First- and second-order systems
- Higher-order systems
- Transient response
- Steady-state error
- Error coefficients
- Performance indices
- PID controller tuning

6. Concepts of Stability and Algebraic Criteria

- Stability concepts
- Routh-Hurwitz criterion
- Stability of control systems
- Relative stability
- Algebraic stability criteria

7. The Root Locus Technique

- Root-locus construction

- Rules for plotting root loci
- Gain determination
- Design using root locus
- Parameter variations
- 8. Frequency Response Analysis**
 - Frequency-response characteristics
 - Polar plots
 - Bode plots
 - Gain and phase characteristics
 - Frequency-domain performance
- 9. Stability in Frequency Domain**
 - Nyquist stability criterion
 - Stability analysis
 - Gain margin
 - Phase margin
 - M and N circles
 - Relative stability

10. Introduction to Design

- Control-system design
- Classical design methods
- Compensators
- Cascade compensation
- Lead compensation
- Lag compensation
- Lead-lag compensation
- PID-controller tuning
- Feedback compensation
- Robust control-system design

11. Digital Control Systems

- Sampling
- Spectrum of sampled signals
- Signal reconstruction
- Difference equations
- Z-transform
- Z-transfer functions
- Inverse Z-transform
- Sampled-data systems
- Relationship between Z- and s-domains
- Stability analysis
- Digital compensation

12. State Variable Analysis and Design

- State and state variables
- State models
- Continuous-time systems
- Discrete-time systems

- State-equation solutions
- Diagonalization
- Controllability
- Observability
- Pole placement
- State feedback
- Observer systems

13. Liapunov's Stability Analysis

- Lyapunov stability criterion
- Direct method of Lyapunov
- Linear systems
- Nonlinear systems
- Construction of Lyapunov functions

14. Optimal Control Systems

- Parameter optimization
- Optimal control using transfer functions
- State-variable approach
- State regulator problem
- Infinite-time regulator
- Output regulation
- Tracking
- Optimization of regulators

15. Nonlinear Systems

- Nonlinear-system characteristics
- Nonlinear analysis
- Phase-plane methods
- Describing functions
- Stability and nonlinear control

16. Advances in Control Systems

- Adaptive control
- Fuzzy-logic control
- Neural-network control
- Modern intelligent-control techniques
