

Contents :

1. **Introduction**
 - Digital control systems
 - Control-system concepts
 - Applications and examples
2. **Discrete-Time Systems and the z-Transform**
 - Discrete-time systems
 - Transform methods
 - Properties of the z-transform
 - Finding z-transforms
 - Difference equations
 - Inverse z-transform
 - Discrete convolution
 - Simulation diagrams and flow graphs
 - State variables
 - Transfer functions
 - State equations and their solutions
3. **Sampling and Reconstruction**
 - Sampled-data control systems
 - Ideal sampling
 - Fourier-transform treatment of sampling
 - Data reconstruction
 - Zero-order hold
 - Sampling effects
4. **Open-Loop Discrete-Time Systems**
 - Discrete models of continuous systems
 - Open-loop transfer functions
 - System response
 - Digital simulation
5. **Closed-Loop Systems**
 - Closed-loop discrete-time systems
 - Characteristic equations
 - Feedback systems
 - System response and accuracy
6. **System Time-Response Characteristics**
 - System time response
 - Characteristic equation
 - Mapping between the s-plane and z-plane
 - Steady-state accuracy
 - Simulation
 - Control software
7. **Stability Analysis Techniques**
 - Stability
 - Bilinear transformation
 - Routh-Hurwitz criterion
 - Jury's stability test
 - Root-locus technique
 - Nyquist criterion
 - Bode diagrams

- Frequency-response interpretation
- 8. Digital Controller Design**
 - Control-system specifications
 - Steady-state accuracy
 - Transient response
 - Relative stability
 - Sensitivity
 - Disturbance rejection
 - Control effort
 - Compensation
 - Phase-lag compensation
 - Phase-lead compensation
 - Lag-lead compensation
 - Integration and differentiation filters
 - PID controllers
 - PID controller design
 - Root-locus design
- 9. Pole-Assignment Design and State Estimation**
 - Pole assignment
 - State estimation
 - Observers
 - State-feedback design
- 10. Linear Quadratic Optimal Control**
 - Optimal control formulation
 - Linear-quadratic regulator
 - Discrete-time optimal control
 - Optimal state feedback
- 11. Sampled-Data Transformation**
 - Transformation of continuous-time systems
 - Analog-to-digital transformations
 - Digital implementation of analog filters/controllers
- 12. Digital Filter Structures**
 - Digital filter realization
 - Filter structures
 - Recursive and nonrecursive structures
 - Filter implementation
- 13. Microcomputer Implementation of Digital Filters**
 - Digital-filter implementation
 - Microcomputer realization
 - Computational considerations
 - Implementation techniques
- 14. Finite-Wordlength Effects**

- Quantization
- Round-off errors
- Finite-register effects
- Coefficient quantization
- Effects on digital filters and control systems

15. Case Studies

- Practical digital-control applications
- Design examples
- Implementation and analysis

Appendices

I. Design Equations

II. The Signal Flow Graph Technique

III. Evaluation of $E^*(s)E^{**}(s)$

IV. Review of Matrices

V. Second-Order Module Subroutines

VI. Eighth-Order Cascaded Filter Routines

VII. Control Software

VIII. z-Transform Tables

Index
