

Contents :

1. Introduction to Real-Time Computer Control

- Historical development
- Characteristics of real-time systems
- Elements of a computer control system
- Time constraints and deadlines

2. Concepts of Computer Control

- Sequence control
- Feedback loop control
- Supervisory control
- Centralized control systems
- Hierarchical control systems

3. Computer Hardware Requirements for Real-Time Applications

- Microprocessors and processors
- Memory organization
- Input/output systems
- Interrupt mechanisms
- Communication interfaces

4. Digital Control Algorithms

- Sampling and reconstruction
- Digital PID control
- Algorithm implementation
- Numerical considerations

5. Programming Languages for Real-Time Applications

- Assembly language
- FORTRAN
- Pascal
- Modula-2
- CORAL 66
- High-level real-time languages

6. Operating Systems

- Real-time operating systems

- Multitasking
- Scheduling policies
- Task management
- Synchronization mechanisms

7. Design of Real-Time Systems

- System specification
- Structured design
- MASCOT methodology
- System integration
- Testing and validation

8. Dependability and Reliability

- Fault detection
- Fault tolerance
- Error recovery
- Safety considerations
- Reliable control systems

9. Implementation Issues

- Software development
- Performance evaluation
- Debugging
- Maintenance
