

Contents :

The book is organized into **13 chapters**:

- 1. General Characteristic of Control Systems**
 - Fundamentals of control systems
 - Open-loop and closed-loop control
 - Computer-based control systems
- 2. Formal Models of Control Systems**
 - Mathematical models
 - Static and dynamic systems
 - Continuous and discrete models
 - State-space representation
- 3. Control for the Given State (the Given Output)**
 - State feedback control
 - Controllability
 - Observability
 - Observer design
 - Structural properties
- 4. Optimal Control with Complete Information on the Plant**
 - Optimal control formulation
 - Performance indices
 - Dynamic optimization
 - Deterministic control
- 5. Parametric Optimization**
 - Parameter optimization
 - Optimization algorithms
 - Design optimization
- 6. Application of Relational Description of Uncertainty**
 - Relational uncertainty models
 - Decision-making under uncertainty
 - Robust control concepts
- 7. Application of Probabilistic Descriptions of Uncertainty**
 - Probability models
 - Random disturbances
 - Stochastic control
 - Bayesian concepts
- 8. Uncertain Variables and Their Applications**
 - Theory of uncertain variables
 - Decision algorithms
 - Control under incomplete information
- 9. Fuzzy Variables, Analogies and Soft Variables**
 - Fuzzy logic
 - Fuzzy control
 - Membership functions
 - Soft computing
 - Approximate reasoning
- 10. Control in Closed-loop Systems – Stability**
 - Feedback systems

- Stability criteria
- Continuous and discrete stability
- Robustness analysis

11. Adaptive and Learning Control Systems

- Adaptive control
- System identification
- Learning algorithms
- Self-tuning controllers

12. Intelligent and Complex Control Systems

- Artificial intelligence
- Knowledge representation
- Expert systems
- Neural networks
- Intelligent decision support

13. Control of Operation Systems

- Operations research
- Scheduling
- Resource allocation
- Manufacturing systems
- Project management
- Logistics control
