

Contents

1. Introduction to reconfigurable mobile radio systems

- Evolution of mobile communication networks
- Need for flexibility and adaptability
- Context of 3G/4G and beyond systems

2. Adaptive services and applications

- Diversity of mobile services
- User-centric adaptation
- Mobility and service continuity

3. System modeling (software radio approach)

- Object-oriented system modeling
- Software architecture of radio terminals
- Concepts of Software Defined Radio (SDR)

4. Dynamic spectrum management

- Radio resource allocation
- Spectrum optimization techniques
- Regulatory and technical constraints

5. Design of reconfigurable terminals

- Hardware/software trade-offs
- Flexible terminal architectures
- Performance vs cost considerations

6. Advanced transmission techniques

- Adaptive MIMO systems
- Signal processing in dynamic environments
- Reconfigurable transmission chains

7. A/D conversion and implementation issues

- Analog-to-digital conversion challenges
- Physical limitations
- Impact on reconfigurability

8. Case studies and practical architectures

- Experimental platforms
- Real-world systems (e.g., UMTS, SDR prototypes)
- Software modem implementations
