

Table of Contents

1. Introduction to Cybernetics and Electric Power Systems

- Fundamentals of cybernetics
- Complex systems and power systems
- Characteristics of large-scale electric power systems
- Principles of control and management
- The role of information in power systems

2. Electric Power Systems as Cybernetic Systems

- Structure of electric power systems
- Generation, transmission and distribution
- Interaction between system components
- Mathematical representation of power systems
- State variables and system parameters

3. Cybernetic Methods for Large Power Systems

- Application of cybernetics to large power systems
- Systems theory
- Mathematical models
- Simulation methods
- Analysis of dynamic processes
- Coordination of different control levels

4. Information and Control in Power Systems

- Information flows
- Measurement and data transmission
- Data acquisition
- Automatic control
- Hierarchical control structures
- Computer-assisted power-system control

5. Forecasting in Electric Power Systems

- Electricity-demand forecasting
- Generation forecasting
- Short-term and long-term forecasting
- Forecasting system development
- Statistical methods and uncertainty

6. Forecasting the Expansion of Power Systems

- Long-term development forecasting
- Growth of electricity consumption
- Development of generating capacity

- Expansion of transmission networks
- Selection of new generating facilities

7. Optimization of Electric Power Systems

- Principles of optimization
- Objective functions
- Technical constraints
- Optimal generation
- Optimal load distribution
- Economic operation of power systems

8. Optimization in Power-System Expansion Planning

- Development planning
- Selection of generating capacity
- Transmission-system expansion
- Economic criteria
- Comparison of alternative development plans
- Technical-economic optimization

9. Technical and Economic Analysis

- Investment costs
- Operating costs
- Economic efficiency
- Cost analysis
- Comparison of alternative solutions
- Technical versus economic performance

10. Reliability and Performance of Power Systems

- Power-system reliability
- Continuity of electricity supply
- Performance evaluation
- Power reserves
- Effects of disturbances
- Security and reliability criteria

11. Control and Management of Power Systems

- Centralized and decentralized control
- Energy-resource management
- Coordination of generating stations
- Control of operating conditions
- Automatic and computer-assisted decision-making

12. Information Analysis and Decision-Making

- Information analysis
- Organization and processing of data
- Information transmission
- Decision-making processes
- Optimization of operational decisions
- Computers in power-system management

13. Cybernetic Approach to Future Power Systems

- Increasing automation of power systems
- Computerized control
- Hierarchical control systems
- Integration of generation, transmission and distribution
- Future development of electric power-system management
